Formed in December 1990, David Ashley Construction Ltd. specialise in reinforced concrete structures and associated groundworks. The company operates both locally and nationally, making our midlands based head office in Alfreton, near junction 28 of the M1, ideally situated.

We carry out a variety of reinforced concrete works on a wide range of projects, including Concrete Frames, Substructures, Highways and Bridgeworks, Water Treatment Works, Power Stations and Stadiums.

Over the past 25 years our family based company has grown in the reinforced concrete market and worked on many prestigious projects for an array of leading main contractors. Our success is based on providing our clients with the highest quality of service and ensuring projects are delivered on budget and to programme.

Our workforce is made up of highly skilled shuttering joiners, steel fixers, concreters, scaffolders and qualified banksmen, all of whom hold a valid CSCS and/or CPCS card and are trained to the highest standard. In addition to this the site teams are supported by experienced and dedicated office staff operating from our head office.

Sectors of work

Reinforced Concrete Frames

We have significant experience of producing a wide range of concrete frames/slabs ranging from small scale single story to high rise multi million pound structures. We strive to get involved as early as possible in the design process in order to enable the quickest possible programme to enable reduced costs.

The last few years have seen us work on projects with some of the major contractors in the business and deliver on all levels to produce a building to the highest quality of finish.

Whilst using traditional forms of construction, we strive on using the very latest techniques and equipment to make the works easier to sequence and provide the highest levels of health and safety.

Bridges and Underpasses

From smaller footbridges over minor roads, to rail bridges over motorways, our recent projects include a large number of bridges on the new section of the A46 and the Nottingham Tram network.

Stadiums

Having completed the stands at Derby County FC and Nottingham Forest FC we can provide any reinforced concrete requirements attached to stadia design, including terracing, slabs, upstands and staircases.

Viaducts & Railways

We have a wealth of experience in providing structures that form part of complex civil engineering packages, ranging from simple track bases right through to viaducts spanning significant distances.

Water & Sewage

We can provide groundworks, drainage and services, as well as holding tanks and other water treatment/sewage structures regardless of size/scale.

Power Stations

Regardless of size and required programme, we can provide a solution. At Ferrybridge Power Station we completed two high rise water towers using the slipform system and working 24hr shifts. The project was completed in line with the very tight programme and to budget.

Residential Projects

Whether it be for groundworks, basements and / or superstructure works, we can provide a service to deliver all requirements on budget and to programme. We have supplied our services on individual, private houses through to large scale residential developments such as care homes and student accommodation.

Commercial/Agricultural Projects

Ranging from small agricultural storage bins to multi million pound commercial compounds, our services can meet all requirements to provide a cost effective and quick solution.

Services

Falsework / Formwork

We cater for numerous falsework designs/requirements, including Hunnebeck (formerly SGB), RMD, Peri and other specialist formwork. Owning our own equipment means we can provide competitive rates and provide a quick turn-around to meet short programme requirements or changes.

Groundworks

We offer services to fulfill a wide range of groundwork requirements including bulk excavation (and removal/disposal of waste), drainage and waterproofing.

Reinforcement

All aspects of reinforcement and steel-fixing can be undertaken through 'labour only' or 'supply and fix.' We can offer traditional fix, post tensioning and the Bamtec rollout carpet reinforcement system. All reinforcement complies with current BS and CE requirements.

Plant & Equipment

We have our own fleet of vehicles, plant and machinery, again maintaining the option to provide more competitive rates and meet tight programmes. The list of plant ranges from the 2t tracked 360° through to the 16t tracked 360°, rollers, dumpers, telehandlers and other associated groundwork's Plant.

Cranage

A wide range of crane solutions can be provided ranging from large tower cranes, crawler, all terrain, mobile, spider and the smaller city cranes. Lift plans, risk assessments and method statements provided as a matter of course.

Concrete Pumping

We can provide a wide range of pumping options including static, mobile and placing booms of varied sizes. Over the years we have been presented with significant pumping challenges, all of which have been overcome by using the varied systems available throughout the market.

Precast

We can provide a wide range of precast concrete units within our services in order to negate the need for further subcontract packages. We work hand in hand with a few of the leading precast suppliers meaning we can guarantee competitive rates and finishes to the highest of standards.

Slipform

We have used the Slipform method for vertical elements on numerous projects, including lift shafts, stair cores and chimneys, minimising crane requirements to speed up the casting process.
